UMOUNT(II)   **UMOUNT(II)**

NAME

        umount − dismount file system

SYNOPSIS

        (umount = 22.)

        sys umount; special

        umount(special);
        char *special;

DESCRIPTION

        Umount announces to the system that special file *special* is no longer to contain a removable file
        system. A *close* is issued to the pertinent device driver. The file associated with the special file
        reverts to its ordinary interpretation; see *mount* (II). Only the super-user may unmount a file
        system.

SEE ALSO

        umount (VIII), mount (II)

DIAGNOSTICS

        Error bit (c-bit) set if no file system was mounted on the special file, if there are still active
        files on the mounted file system, or if the user is not super-user. From C, a −1 return indi-
        cates an error.
